

>>> FEATURES

TURN TRACKER

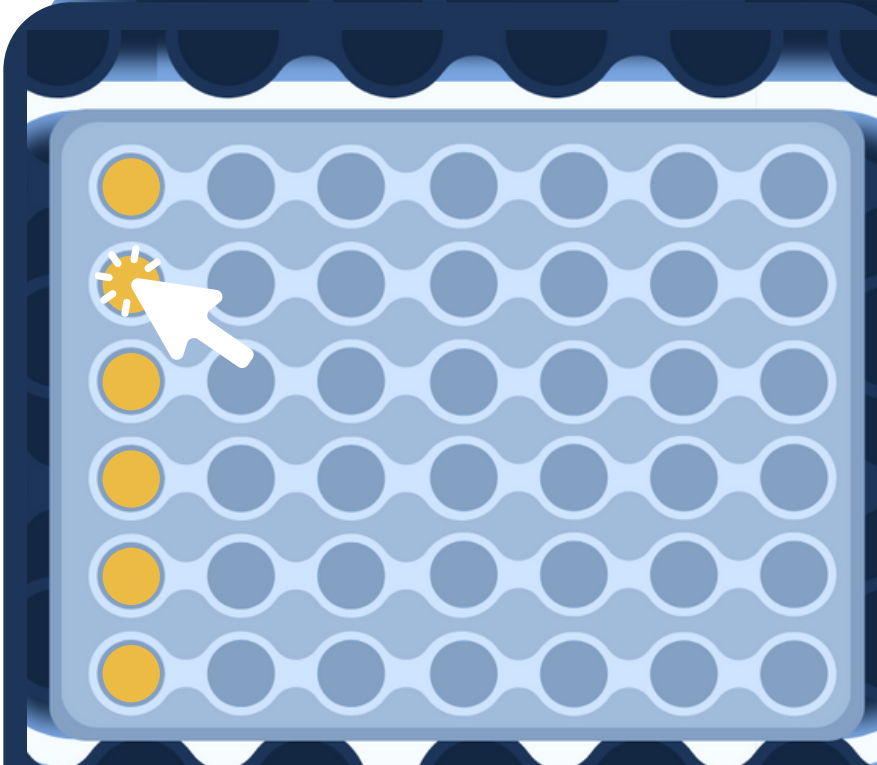

Glows the "Player #" to indicate whose turn it is.

>>> FEATURES

COLUMN SELECTOR

Highlights the column when hovered on.

>>> HOW TO PLAY

1. *Hover and click the "Play" button on the main screen.*
2. *In Connect 4, you need two players, so pick one, either as player 1 or player 2.*
3. *Player 1 (red disk) always goes first, hover your mouse over the board with holes, select a column where you want to place, and fall your first disk. This goes as well with Player 2 (yellow disk).*
4. *The sides (w/ player 1 or 2) indicate whose turn it is by glowing.*
5. *The first player to connect 4 same colored disks (horizontally, vertically, or diagonally) wins.*
6. *If all the holes are filled, then the system concludes the game to be a draw.*

>>> GAME DEVELOPMENT

Start Screen

The game's start screen composes of a class called `StartDisplay` which contains several methods that display the images and shapes to indicate that the user is on the start menu of the game. Other methods also allows the start menu to be functional by adding buttons that let the user to start the game or learn how to play the game.

>>> GAME DEVELOPMENT

End Screen

For the end screen, we have implemented several methods to make this segment of the program functional. These methods include displaying the images that shows the result of that specific game, and a button that will allow the user to go back to the main screen to try for another game.

>>> GAME DEVELOPMENT

ENGINE

The engine is the main driving class of the program. It handles the inputs of the user as well as the displaying of graphics. Additionally, it handles communication between the different classes implemented.

>>> GAME DEVELOPMENT

BOARD

Handles all the back end game logic on a grid represented as a 2D array

>>> GAME DEVELOPMENT

BOARD DISPLAY

Reads the board state from the Board class and displays it graphically on screen. Contains a 2D array of circles (from the SFML library) to represent the chips.
